Roadmap

① Embedding Numerous Features: Kernel Models

Lecture 3: Kernel Support Vector Machine

kernel as a shortcut to (transform + inner product) to **remove dependence on \tilde{d}** : allowing a spectrum of simple (**linear**) models to infinite dimensional (**Gaussian**) ones with margin control

Lecture 4: Soft-Margin Support Vector Machine

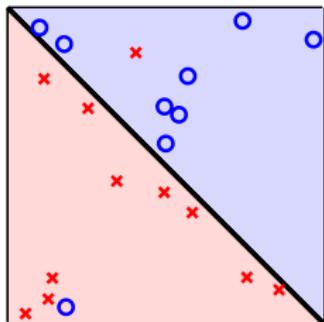

- Motivation and Primal Problem
- Dual Problem
- Messages behind Soft-Margin SVM
- Model Selection

② Combining Predictive Features: Aggregation Models

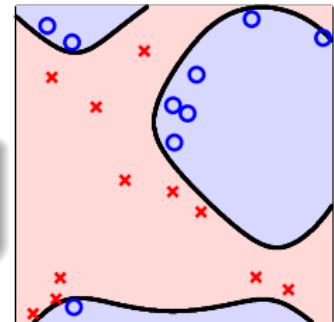

③ Distilling Implicit Features: Extraction Models

Cons of Hard-Margin SVM

recall: SVM can still overfit :-(

 Φ_1

- part of reasons: Φ
- other part: **separable**

 Φ_4

if always insisting on **separable** (\Rightarrow shatter),
have power to **overfit to noise**

Give Up on Some Examples

want: **give up** on some noisy examples

Pocket : 容許做錯的點，可是這些做錯的點錯誤要越小越好！

pocket

$$\min_{b, \mathbf{w}} \sum_{n=1}^N [\![y_n \neq \text{sign}(\mathbf{w}^T \mathbf{z}_n + b)]\!]$$

hard-margin SVM

$$\begin{aligned} \min_{b, \mathbf{w}} \quad & \frac{1}{2} \mathbf{w}^T \mathbf{w} \\ \text{s.t.} \quad & y_n (\mathbf{w}^T \mathbf{z}_n + b) \geq 1 \text{ for all } n \end{aligned}$$

現在我們想要把上述兩個觀念融合在一起，你可以有錯誤的歸類點，可是錯誤要最小：

combination: $\min_{b, \mathbf{w}} \frac{1}{2} \mathbf{w}^T \mathbf{w} + C \cdot \sum_{n=1}^N [\![y_n \neq \text{sign}(\mathbf{w}^T \mathbf{z}_n + b)]\!]$

s.t. $y_n (\mathbf{w}^T \mathbf{z}_n + b) \geq 1$ for **correct** n
 $y_n (\mathbf{w}^T \mathbf{z}_n + b) \geq -\infty$ for **incorrect** n

C: trade-off of **large margin** & **noise tolerance**

Soft-Margin SVM (1/2)

$$\min_{b, \mathbf{w}} \quad \frac{1}{2} \mathbf{w}^T \mathbf{w} + C \cdot \sum_{n=1}^N [\![y_n \neq \text{sign}(\mathbf{w}^T \mathbf{z}_n + b)]\!]$$

$$\text{s.t.} \quad y_n(\mathbf{w}^T \mathbf{z}_n + b) \geq 1 - \infty \cdot [\![y_n \neq \text{sign}(\mathbf{w}^T \mathbf{z}_n + b)]\!]$$

- $[\![\cdot]\!]$: non-linear, **not QP anymore** :-(
—what about dual? kernel?
- cannot distinguish **small error** (slightly away from fat boundary)
or **large error** (a...w...a...y... from fat boundary)

引入一個新的式子 ξ_i 來表示小錯或是大錯 (不只沒落在邊界、還跨錯邊界！)

- record '**margin violation**' by ξ_i —**linear constraints**
- penalize with **margin violation** instead of **error count**
—**quadratic objective**

soft-margin SVM: $\min_{b, \mathbf{w}, \xi} \quad \frac{1}{2} \mathbf{w}^T \mathbf{w} + C \cdot \sum_{n=1}^N \xi_n$ 離1很近代表小錯; 離1很遠大表大錯

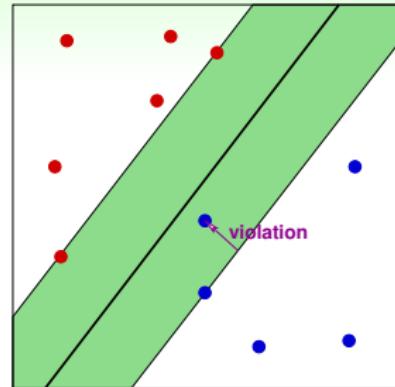

$$\text{s.t.} \quad y_n(\mathbf{w}^T \mathbf{z}_n + b) \geq 1 - \xi_n \text{ and } \xi_n \geq 0 \text{ for all } n$$

Soft-Margin SVM (2/2)

- record ‘margin violation’ by ξ_n
- penalize with margin violation

$$\min_{b, \mathbf{w}, \xi} \quad \frac{1}{2} \mathbf{w}^T \mathbf{w} + C \cdot \sum_{n=1}^N \xi_n$$

s.t. $y_n(\mathbf{w}^T \mathbf{z}_n + b) \geq 1 - \xi_n$ and $\xi_n \geq 0$ for all n

- parameter C : trade-off of large margin & margin violation
 - large C : want less margin violation
 - small C : want large margin
- QP of $\tilde{d} + 1 + N$ variables, $2N$ constraints

next: remove dependence on \tilde{d} by
soft-margin SVM primal \Rightarrow dual?

Fun Time

At the optimal solution of

$$\begin{aligned} \min_{b, \mathbf{w}, \xi} \quad & \frac{1}{2} \mathbf{w}^T \mathbf{w} + C \cdot \sum_{n=1}^N \xi_n \\ \text{s.t.} \quad & y_n (\mathbf{w}^T \mathbf{z}_n + b) \geq 1 - \xi_n \text{ and } \xi_n \geq 0 \text{ for all } n, \end{aligned}$$

assume that $y_1(\mathbf{w}^T \mathbf{z}_1 + b) = -10$. What is the corresponding ξ_1 ?

- ① 1
- ② 11
- ③ 21
- ④ 31

Fun Time

At the optimal solution of

$$\begin{aligned} \min_{b, \mathbf{w}, \xi} \quad & \frac{1}{2} \mathbf{w}^T \mathbf{w} + C \cdot \sum_{n=1}^N \xi_n \\ \text{s.t.} \quad & y_n (\mathbf{w}^T \mathbf{z}_n + b) \geq 1 - \xi_n \text{ and } \xi_n \geq 0 \text{ for all } n, \end{aligned}$$

assume that $y_1(\mathbf{w}^T \mathbf{z}_1 + b) = -10$. What is the corresponding ξ_1 ?

- ① 1
- ② 11
- ③ 21
- ④ 31

Reference Answer: ②

ξ_1 is simply $1 - y_1(\mathbf{w}^T \mathbf{z}_1 + b)$ when
 $y_1(\mathbf{w}^T \mathbf{z}_1 + b) \leq 1$.

推導這個限制式下的對偶問題：

Lagrange Dual

primal: $\min_{b, \mathbf{w}, \xi} \frac{1}{2} \mathbf{w}^T \mathbf{w} + C \cdot \sum_{n=1}^N \xi_n$

s.t. $y_n(\mathbf{w}^T \mathbf{z}_n + b) \geq 1 - \xi_n$ and $\xi_n \geq 0$ for all n

Lagrange function with Lagrange multipliers α_n and β_n

$$\begin{aligned} \mathcal{L}(b, \mathbf{w}, \xi, \boldsymbol{\alpha}, \boldsymbol{\beta}) &= \frac{1}{2} \mathbf{w}^T \mathbf{w} + C \cdot \sum_{n=1}^N \xi_n \\ &+ \sum_{n=1}^N \alpha_n \cdot (1 - \xi_n - y_n(\mathbf{w}^T \mathbf{z}_n + b)) + \sum_{n=1}^N \beta_n \cdot (-\xi_n) \end{aligned}$$

want: Lagrange dual

$$\max_{\alpha_n \geq 0, \beta_n \geq 0} \left(\min_{b, \mathbf{w}, \xi} \mathcal{L}(b, \mathbf{w}, \xi, \boldsymbol{\alpha}, \boldsymbol{\beta}) \right)$$

Simplify ξ_n and β_n

$$\max_{\alpha_n \geq 0, \beta_n \geq 0} \left(\min_{b, \mathbf{w}, \xi} \frac{1}{2} \mathbf{w}^T \mathbf{w} + C \cdot \sum_{n=1}^N \xi_n \right. \\ \left. + \sum_{n=1}^N \alpha_n \cdot (1 - \xi_n - y_n(\mathbf{w}^T \mathbf{z}_n + b)) + \sum_{n=1}^N \beta_n \cdot (-\xi_n) \right)$$

- $\frac{\partial \mathcal{L}}{\partial \xi_n} = 0 = C - \alpha_n - \beta_n$
- no loss of optimality if solving with implicit constraint $\beta_n = C - \alpha_n$ and explicit constraint $0 \leq \alpha_n \leq C$: β_n removed

ξ can also be removed :-), like how we removed b

$$\max_{0 \leq \alpha_n \leq C, \beta_n = C - \alpha_n} \left(\min_{b, \mathbf{w}, \xi} \frac{1}{2} \mathbf{w}^T \mathbf{w} + \sum_{n=1}^N \alpha_n (1 - y_n(\mathbf{w}^T \mathbf{z}_n + b)) \right. \\ \left. + \sum_{n=1}^N (C - \alpha_n - \beta_n) \cdot \xi_n \right)$$

Other Simplifications

$$\max_{0 \leq \alpha_n \leq C, \beta_n = C - \alpha_n} \left(\min_{b, \mathbf{w}} \frac{1}{2} \mathbf{w}^T \mathbf{w} + \sum_{n=1}^N \alpha_n (1 - y_n (\mathbf{w}^T \mathbf{z}_n + b)) \right)$$

familiar? :-)

- inner problem **same as hard-margin SVM**
- $\frac{\partial \mathcal{L}}{\partial b} = 0$: no loss of optimality if solving with constraint $\sum_{n=1}^N \alpha_n y_n = 0$
- $\frac{\partial \mathcal{L}}{\partial \mathbf{w}_i} = 0$: no loss of optimality if solving with constraint

$$\mathbf{w} = \sum_{n=1}^N \alpha_n y_n \mathbf{z}_n$$

standard dual can be derived
using the same steps as Lecture 2

Standard Soft-Margin SVM Dual

$$\min_{\alpha} \quad \frac{1}{2} \sum_{n=1}^N \sum_{m=1}^N \alpha_n \alpha_m y_n y_m \mathbf{z}_n^T \mathbf{z}_m - \sum_{n=1}^N \alpha_n$$

subject to $\sum_{n=1}^N y_n \alpha_n = 0;$

$0 \leq \alpha_n \leq C$, for $n = 1, 2, \dots, N$;

implicitly $\mathbf{w} = \sum_{n=1}^N \alpha_n y_n \mathbf{z}_n$;

$\beta_n = C - \alpha_n$, for $n = 1, 2, \dots, N$

—only difference to hard-margin: upper bound on α_n

another (convex) QP,
with N variables & $2N + 1$ constraints

Fun Time

In the soft-margin SVM, assume that we want to increase the parameter C by 2. How shall the corresponding dual problem be changed?

- ① the upper bound of α_n shall be halved
- ② the upper bound of α_n shall be decreased by 2
- ③ the upper bound of α_n shall be increased by 2
- ④ the upper bound of α_n shall be doubled

Fun Time

In the soft-margin SVM, assume that we want to increase the parameter C by 2. How shall the corresponding dual problem be changed?

- ① the upper bound of α_n shall be halved
- ② the upper bound of α_n shall be decreased by 2
- ③ the upper bound of α_n shall be increased by 2
- ④ the upper bound of α_n shall be doubled

Reference Answer: ③

Because C is exactly the upper bound of α_n , increasing C by 2 in the primal problem is equivalent to increasing the upper bound by 2 in the dual problem.

Kernel Soft-Margin SVM

Kernel Soft-Margin SVM Algorithm

- ① $q_{n,m} = y_n y_m K(\mathbf{x}_n, \mathbf{x}_m)$; $\mathbf{p} = -\mathbf{1}_N$; (\mathbf{A}, \mathbf{c}) for equ./lower-bound/upper-bound constraints
- ② $\alpha \leftarrow \text{QP}(\mathbf{Q}_D, \mathbf{p}, \mathbf{A}, \mathbf{c})$
- ③ $b \leftarrow ?$
- ④ return SVs and their α_n as well as b such that for new \mathbf{x} ,

$$g_{\text{SVM}}(\mathbf{x}) = \text{sign} \left(\sum_{\text{SV indices } n} \alpha_n y_n K(\mathbf{x}_n, \mathbf{x}) + b \right)$$

- almost the same as hard-margin
- more flexible than hard-margin
 - primal/dual always solvable

remaining question: step ③?

Solving for b

hard-margin SVM

complementary slackness:

$$\alpha_n(1 - y_n(\mathbf{w}^T \mathbf{z}_n + b)) = 0$$

- SV ($\alpha_s > 0$)

$$\Rightarrow b = y_s - \mathbf{w}^T \mathbf{z}_s$$

soft-margin SVM

complementary slackness:

$$\alpha_n(1 - \xi_n - y_n(\mathbf{w}^T \mathbf{z}_n + b)) = 0$$

from $\beta_n * (-\xi_n) = 0 : (C - \alpha_n)\xi_n = 0$

- SV ($\alpha_s > 0$)

$$\Rightarrow b = y_s - y_s \xi_s - \mathbf{w}^T \mathbf{z}_s$$

- free ($\alpha_s < C$)

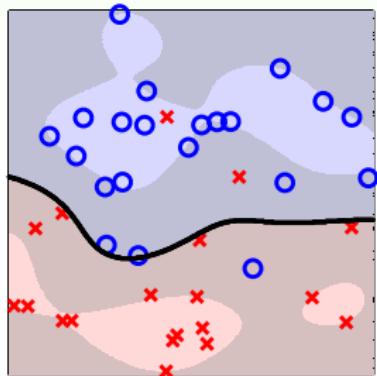

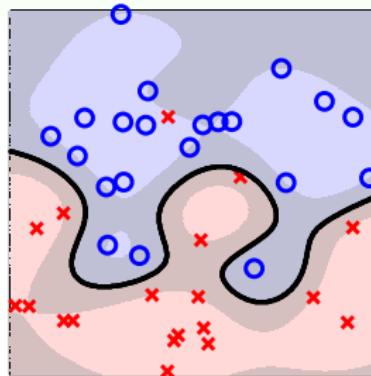

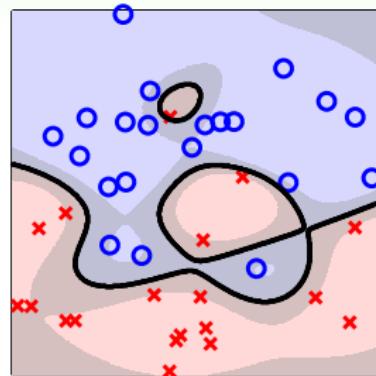

$$\Rightarrow \xi_s = 0$$

solve unique b with free SV (\mathbf{x}_s, y_s):

$$b = y_s - \sum_{\text{SV indices } n} \alpha_n y_n K(\mathbf{x}_n, \mathbf{x}_s)$$

—range of b otherwise

Soft-Margin Gaussian SVM in Action

 $C = 1$  $C = 10$  $C = 100$

- large $C \Rightarrow$ less noise tolerance \Rightarrow ‘overfit’?
- warning: SVM can still overfit :-(

由此可見，即使在soft下，容忍度參數C即使沒有選好，仍有可能會發生over-fitting

soft-margin Gaussian SVM:
need careful selection of (γ, C)

Physical Meaning of α_n

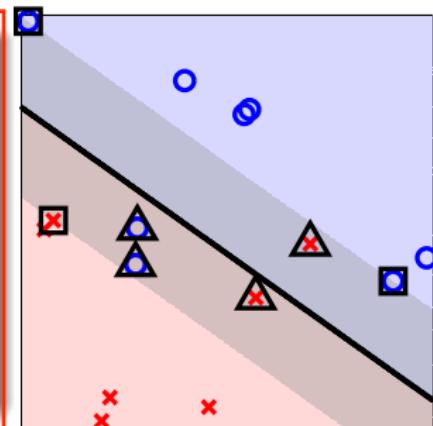

complementary slackness:

$$\alpha_n(1 - \xi_n - y_n(\mathbf{w}^T \mathbf{z}_n + b)) = 0$$

$$(C - \alpha_n)\xi_n = 0$$

透過 α_n 可以把資料點做分類

- non SV ($0 = \alpha_n$): $\xi_n = 0$,
‘away from’/on fat boundary
- □ free SV ($0 < \alpha_n < C$): $\xi_n = 0$,
on fat boundary, locates b
- △ bounded SV ($\alpha_n = C$):
 ξ_n = violation amount,
‘violate’/on fat boundary

α_n can be used for **data analysis**

Fun Time

For a data set of size 10000, after solving SVM, assume that there are 1126 support vectors, and 1000 of those support vectors are bounded. What is the possible range of $E_{in}(g_{SVM})$ in terms of 0/1 error?

- 1 $0.0000 \leq E_{in}(g_{SVM}) \leq 0.1000$
- 2 $0.1000 \leq E_{in}(g_{SVM}) \leq 0.1126$
- 3 $0.1126 \leq E_{in}(g_{SVM}) \leq 0.5000$
- 4 $0.1126 \leq E_{in}(g_{SVM}) \leq 1.0000$

Fun Time

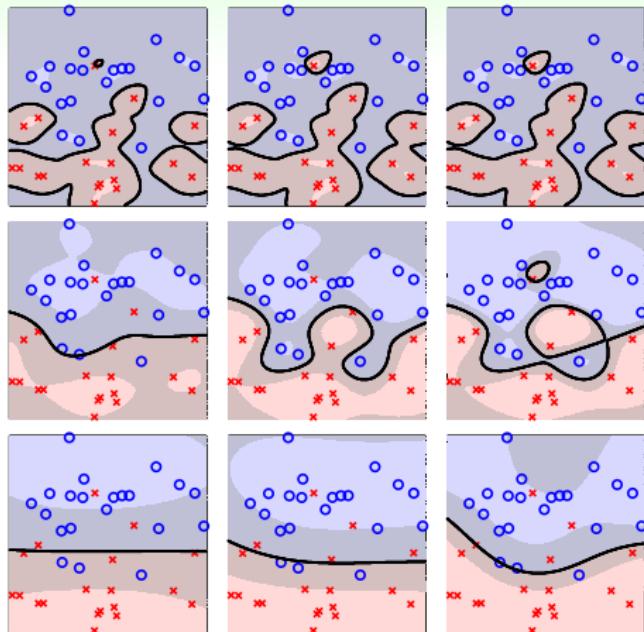

For a data set of size 10000, after solving SVM, assume that there are 1126 support vectors, and 1000 of those support vectors are bounded. What is the possible range of $E_{in}(g_{SVM})$ in terms of 0/1 error?

- ① $0.0000 \leq E_{in}(g_{SVM}) \leq 0.1000$
- ② $0.1000 \leq E_{in}(g_{SVM}) \leq 0.1126$
- ③ $0.1126 \leq E_{in}(g_{SVM}) \leq 0.5000$
- ④ $0.1126 \leq E_{in}(g_{SVM}) \leq 1.0000$

Reference Answer: ①

The bounded support vectors are the only ones that could violate the fat boundary:
 $\xi_n \geq 0$. If $\xi_n \geq 1$, then the violation causes a 0/1 error on the example. On the other hand, it is also possible that $\xi_n < 1$, and in that case the violation does not cause a 0/1 error.

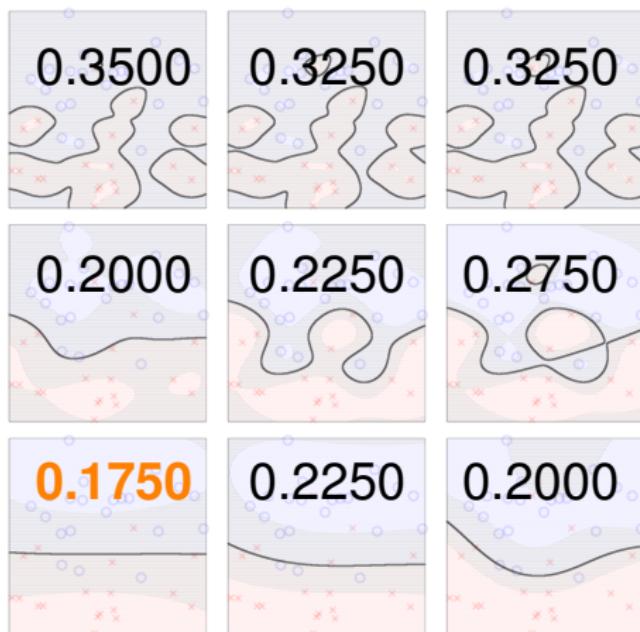

Practical Need: Model Selection

- complicated even for (C, γ) of Gaussian SVM
- more combinations if including other kernels or parameters

how to select? validation :-)

Selection by Cross Validation

- $E_{cv}(C, \gamma)$: 'non-smooth' function of (C, γ)
—**difficult to optimize**
- proper models can be chosen by **V-fold cross validation on a few grid values of (C, γ)**

E_{cv} : very popular criteria for soft-margin SVM

Leave-One-Out CV Error for SVM

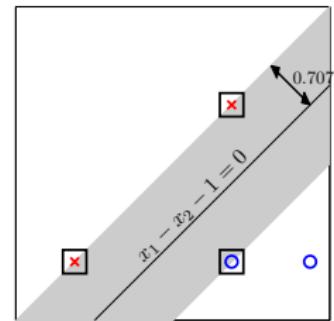

recall: $E_{\text{loocv}} = E_{\text{cv}}$ with N folds

這裡可以證明的是：loocv的error會小於等於support vector擁有的比例：

claim: $E_{\text{loocv}} \leq \frac{\#\text{SV}}{N}$

- for (\mathbf{x}_N, y_N) : if optimal $\alpha_N = 0$ (non-SV)
 $\Rightarrow (\alpha_1, \alpha_2, \dots, \alpha_{N-1})$ still optimal when
 leaving out (\mathbf{x}_N, y_N) 即使把non-support
 vector拿掉，對我們
 的邊界也沒有影響。
 key: what if there's better α_n ?
- SVM: $g^- = g$ when leaving out non-SV

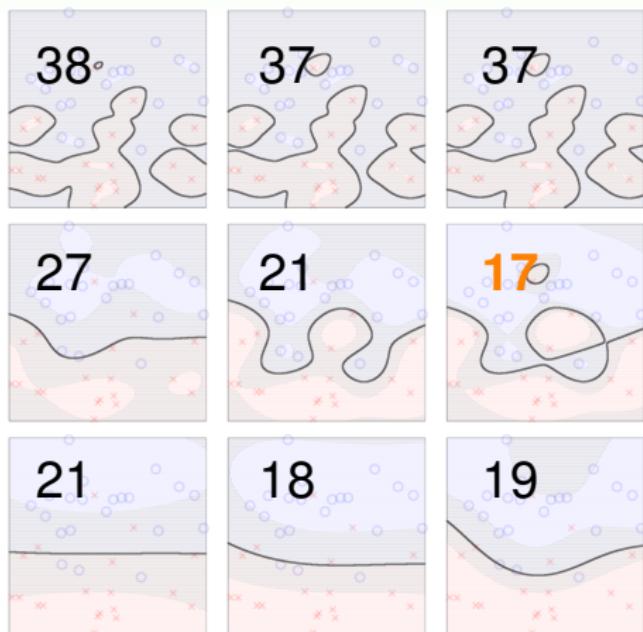

$$\begin{aligned} e_{\text{non-SV}} &= \text{err}(g^-, \text{non-SV}) \\ &= \text{err}(g, \text{non-SV}) = 0 \\ e_{\text{SV}} &\leq 1 \end{aligned}$$

motivation from
 hard-margin SVM:
 only **SVs needed**

scaled #SV bounds leave-one-out CV error

Selection by # SV

- $nSV(C, \gamma)$: ‘non-smooth’ function of (C, γ)
—**difficult to optimize**
- **just an upper bound!**
- dangerous models can be ruled out by **nSV** on **a few grid values of (C, γ)**

nSV: often used as a **safety check** if computing E_{cv} is too time-consuming

Fun Time

For a data set of size 10000, after solving SVM on some parameters, assume that there are 1126 support vectors, and 1000 of those support vectors are bounded. Which of the following cannot be E_{loocv} with those parameters?

- 1 0.0000
- 2 0.0805
- 3 0.1111
- 4 0.5566

Fun Time

For a data set of size 10000, after solving SVM on some parameters, assume that there are 1126 support vectors, and 1000 of those support vectors are bounded. Which of the following cannot be E_{loocv} with those parameters?

- 1 0.0000
- 2 0.0805
- 3 0.1111
- 4 0.5566

Reference Answer: 4

Note that the upper bound of E_{loocv} is 0.1126.

Summary

1 Embedding Numerous Features: Kernel Models

Lecture 4: Soft-Margin Support Vector Machine

- Motivation and Primal Problem
 - add margin violations ξ_n
- Dual Problem
 - upper-bound α_n by C
- Messages behind Soft-Margin SVM
 - bounded/free SVs for data analysis
- Model Selection
 - cross-validation, or approximately nSV

- next: other kernel models for soft binary classification

2 Combining Predictive Features: Aggregation Models

3 Distilling Implicit Features: Extraction Models
